## Section 5.3

1. Carry out the three different traversals in the following tree:

Figure 1:

2. In this exercise we consider trees corresponding to algebraic expressions. The idea is that each binary operator is represented by a node, whose children are the two operands. For example the expression  $2 * (3 + 1/2)$  would be represented via the tree in the figure.

Figure 2:

- a. Create a similar tree for the expression  $3 + (1 / (4 + 5))$
- b. If we wanted to evaluate the expression by traversing the tree, which of the three traversals would we follow?
